Attorney Docket No. 087805-9016

Dear Examiner Tran:

Thank you for agreeing to have a telephonic interview regarding this application on Friday, December 16, 2005, at 3:00 PM Eastern Time.

As you requested, I am sending this message to provide a summary of the proposed discussion.

The substance of the interview will involve the assertion of the Office that, when  $k_1$ ,  $k_2$ , and  $k_3$  are constants that  $a*k_1 + b*k_2 + c*k_3 = a*b*c$  (EQ. 1). With due respect, the Applicant notes that the sum (addition) of three values or signals is not equal to the product (multiplication) of the same three values or signals. In order to avoid the costs (which will be incurred by both the Office and the Applicant) of filing either a Pre-Appeal Brief Request for Review or an Appeal, Applicant respectfully requests that the Office reconsider and withdraw its rejection.

The Office appears to treat multiplication and addition as equivalents. The fact that there are rare circumstances (such as  $0*0=0$  and  $0+0=0$ ; and  $2+2=4$  and  $2*2=4$ ) where the results of multiplication and addition are the same does not change what Applicant can only describe as a fundamental maxim of mathematics: addition and multiplication are not the same or equivalent to each other. The fact that the Office can point to some rare circumstances where addition and multiplication yield the same result does not mean that the reference teaches the claimed subject matter. The fallacy of the Office's argument becomes clearer if one takes the next step in the Office's argument and attempts to substitute, in real world conditions, signal processors that sum signals for signal processors that multiply signals. This simply would not work and any person of ordinary skill in the art would recognize this to be so. As Applicant noted in prior submissions,

... Chen does not multiply signals together, as claimed in Claim 1. This difference is fundamental and is highlighted in the table on page 3 of the present application where the two different types of operation are clearly distinguished. It is also noted that the two different types of operation require different implementations, each having different associated costs.

In other words, multiplication and addition are not implemented using the same hardware and software and the costs of implementing each are different, which further evidences that the two are not equivalents.

The Applicant will also note that the Office has taken what was intended to be a teaching example provided by the Applicant and through hindsight analysis and supplementation of the reference relied upon, rejected the claims. First, Applicant notes that the circumstances under which EQ. 1 are true are even rarer than what the Office supposes. Not only would  $k_1$ ,  $k_2$ , and  $k_3$  have to be constants, but it appears that they would have to be equal fractions and that  $a$ ,  $b$ , and  $c$  would have to be equal to each other. For example,  $k_1=k_2=k_3=1/3$  and  $a=b=c=1$ . If  $k_1$ ,  $k_2$ , and  $k_3$  are constant (or invariable) only, there are no circumstance (as best as Applicant can determine) where EQ. 1 is true, except where  $a=b=c=0$ . Second, and more importantly, Chen never teaches or suggests these circumstances or that known mathematical coincidences where multiplication and addition yield the same result cause the two operations (or devices) to be equivalent. Accordingly, a withdrawal of the present rejection is in order.

It is not expected that other matters will be discussed.

Regards,

Derek C. Stettner
